

# The Graph Method

by Sophia

## WHAT'S COVERED

In this lesson, you will evaluate limits by using the graph of a function. Specifically, this lesson will cover:

1. Defining Limit Notation
2. Using Graphs to Evaluate Limits

## 1. Defining Limit Notation

Consider the function  $f(x) = \frac{x^2 - 1}{x - 1}$ .

Notice that  $f(x)$  is undefined when  $x = 1$ . However, we still may want to analyze the behavior of  $f(x)$  around  $x = 1$ . The mathematical tool used to do this sort of analysis is called a limit.

### BIG IDEA

$\lim_{x \rightarrow a} f(x) = L$  means “the limit of  $f(x)$  as  $x$  gets closer to  $a$  is equal to  $L$ ”. In other words, as  $x$  gets closer to  $a$ , the value of  $f(x)$  gets closer to  $L$ . We call  $L$  the limit of the function  $f(x)$ .

To see how this works graphically, shown below is the graph of  $f(x) = \frac{x^2 - 1}{x - 1}$ .

Notice that there is a hole in the graph at the point  $(1, 2)$ , indicating that the graph of  $f(x)$  is a line, but excludes the point  $(1, 2)$ .

Since  $f(x)$  is undefined when  $x = 1$ , we analyze the behavior of  $f(x)$  by using limits.

That is, we want to evaluate  $\lim_{x \rightarrow 1} f(x)$  or more specifically,  $\lim_{x \rightarrow 1} \frac{x^2 - 1}{x - 1}$ .

By examining the graph, it appears that as  $x$  gets closer and closer to 1,  $f(x)$  gets closer and closer to 2. Thus,

we can write  $\lim_{x \rightarrow 1} \frac{x^2 - 1}{x - 1} = 2$ .

Limit

The value that a function  $f(x)$  approaches as  $x$  gets closer to a specified number.

## 2. Using Graphs to Evaluate Limits

We can use the information from a graph to evaluate a limit.

⇒ EXAMPLE Consider the graph of some function  $y = f(x)$ .

We can say the following:

| Statement                                     | Description  |
|---|--|
| $\lim_{x \rightarrow 0} f(x) = 1$             | As $x$ gets closer to 0, $f(x)$ gets closer to 1.  |
| $\lim_{x \rightarrow 1} f(x) = 1$             | As $x$ gets closer to 1, $f(x)$ gets closer to 1.  |
| $\lim_{x \rightarrow 2} f(x)$ does not exist. | As $x$ gets closer to 2 from the left (values smaller than 2), $f(x)$ gets closer to 1. However, as $x$ gets closer to 2 from the right (values larger than 2), $f(x)$ gets closer to 2. |

|  |  |
|--|--|
|  | Since $f(x)$ approaches two different values, as $x$ approaches 2, we say the limit does not exist.  |
| $\lim_{x \rightarrow 3} f(x) = 2$  | As $x$ gets closer to 3, $f(x)$ gets closer to 2. Note that the actual value of $f(3)$ is 1 (closed dot at $x = 3$ ), but the limit tells us what is happening as we get closer and closer to 3, not what is happening right at 3. |
| $\lim_{x \rightarrow 4} f(x) = 0$  | As $x$ gets closer to 4, $f(x)$ gets closer to 0.  |
|  TRY IT |  |

Consider the graph pictured below.

Evaluate the function as  $x$  approaches 1.

+

$$\lim_{x \rightarrow 1} f(x) = 2$$

Evaluate the function as  $x$  approaches 2.

+

$$\lim_{x \rightarrow 2} f(x) = 2$$

Evaluate the function as  $x$  approaches 3.

+

$\lim_{x \rightarrow 3} f(x)$  does not exist

Evaluate the function as  $x$  approaches 4.

+

$\lim_{x \rightarrow 4} f(x) = 2$

## SUMMARY

In this lesson, you learned about **defining limit notation**, or how the limit of a function is used to determine the behavior (or value) a function  $f(x)$  approaches as  $x$  gets closer to some value. You also learned that you can **use the information from a graph to evaluate a limit**.
